
Proforma Financial Model

Step-by-Step Task Guide

A beginner-friendly orientation to RedTeam’s proforma model — the linked Excel workbook that holds P&L actuals, unit economics, and the ARR forecast — and how to update it each month from QuickBooks and HubSpot.

Source: “Proforma Overview” recording + its Google Meet transcript

Recorded: July 23, 2026, 1:30 PM MDT (approx. 54 minutes)

Presenter / trainer: Greg Coble • **Trainee:** Connor Schone

Systems: the RedTeam Proforma Financial Model (Excel), fed from QuickBooks Online and HubSpot

How this guide was built. Steps, screenshots, and on-screen values were read from the recording’s video frames, and the green “From the meeting transcript” quotes are **verbatim** from the meeting’s Google Meet transcript (lightly trimmed for filler words), tagged with speaker and timestamp.

Set expectations. The proforma is a large, heavily-linked model that both Greg and Connor call a “Frankenstein” / “scavenger hunt” — most updates are manual copy/paste, drag-down formulas, and fixing filters and dates. This guide documents the process **as it is today**; the stated goal is to simplify and automate it over time (define the outputs first, then rebuild).

The big picture

What the model is and where its data comes from

The **Proforma Financial Model** is one big Excel workbook of linked tabs: **P&L Actual** and **P&L High-Level** summaries, **Unit Economics**, the ARR forecast (**Bookings_Build**, **Renewals_Build**, **ARR roll-forward**, and the deferred-revenue / bookings **waterfalls**), plus **HubSpot** export tabs (ARR stack, customer list, renewals, churn, APV) and department budget tabs. Each month you refresh it from two sources: **QuickBooks** (the financial actuals) and **HubSpot** (revenue, renewals, churn, bookings). An **Instructions** tab links out to each source.

Two recurring gotchas. (1) After pasting new data you usually must **extend the filters/date ranges** to the current month, or reports come out incomplete. (2) HubSpot **company record IDs sometimes change**, which breaks the model's lookups — the most common thing to troubleshoot.

Updating the model each month

Excel workbook fed from QuickBooks + HubSpot

Step 1 — Get oriented in the workbook

Open the model and skim the tab bar along the bottom: **Instructions**, **P&L Actual**, **P&L High-Level**, **Unit Economics**, **Dataset**, **Bookings_Build**, **Renewals_Build**, the **waterfalls**, **HubSpot_ARR_Stack**, **APV**, **Churn Detail**, and the department tabs. The **Instructions** tab has links that open each HubSpot source. Almost everything is formula-driven off pasted exports, so the monthly job is really “refresh each source tab, then let the formulas roll up.”

- 1 Open the Proforma Financial Model workbook.
- 2 Review the tabs and how they feed the P&L Actual and High-Level summaries.
- 3 Use the **Instructions** tab's links to reach each HubSpot source.

The screenshot displays the 'Instructions' tab of the Proforma Financial Model. The interface includes a standard Excel ribbon at the top and a tab bar at the bottom. The main grid contains a complex financial model with columns representing time periods from Q3-20 to Q2-28. Rows are organized into sections such as 'Revenue Forecast from Base', 'Expenses', 'Profit', and 'Monthly Revenue'. A video call window is overlaid on the right side of the spreadsheet, showing participants in a meeting.

The model's tab bar and the ARR roll-forward — dozens of linked tabs feed the summaries.

"This is like a scavenger hunt..."

Step 2 — Update the P&L actuals from QuickBooks

On the **P&L Actual** tab, bring in the new month from QuickBooks: **copy** and **paste** the QuickBooks P&L into the worksheet, type the **month-end date** in the date cell (the formulas key off it), and **drag the formulas down**. Pull from the **entity-level** P&Ls (Paser, RedTeam Software) rather than only the consolidated view — the entity reports carry more detail, such as broken-out discounts.

- 1 On **P&L Actual**, paste the new month's QuickBooks P&L into the sheet.
- 2 Enter the month-end date so the formulas grab the right column.
- 3 Drag the formulas down; copy the summary rows down as needed.
- 4 Use entity-level P&Ls for detail (e.g. discounts), not just consolidated.

The screenshot displays a Google Sheets spreadsheet titled "P&L Actual". The spreadsheet is organized into columns for "Date", "Amount", and "Description". The data is presented in a tabular format, with rows representing different months and years. The spreadsheet is filled with data from QuickBooks, including columns for Date, Amount, and Description. The data is organized into rows for different months and years. The spreadsheet is titled "P&L Actual" and shows a detailed breakdown of financial data. The bottom of the screen shows a Windows taskbar with various application icons and a system clock indicating 2:17 PM on 10/26/2020.

The P&L Actual area — pasted QuickBooks data with drag-down formulas.

FROM THE MEETING TRANSCRIPT — Greg Coble, 00:07:18

"I would cut and paste this in for 6/30... then you're drag-and-dropping this information down, and just entering the date — these are formula driven, but the date you'll need to put in."

Step 3 — Refresh the HubSpot source tabs

Update the tabs that come from HubSpot — the **ARR stack**, **customer list**, **renewals**, and **churn**. Open each from the **Instructions** links, export it, and drop it into its tab so the model's formulas pull from the HubSpot summary. Note the **ARR stack shows paying clients only** — non-paying clients won't appear — and remember to extend filters to the current month.

- 1 Open each HubSpot source from the **Instructions** tab and export it.
- 2 Paste each export into its tab; confirm formulas pull from the HubSpot summary.
- 3 Extend filters/date ranges to the current month.
- 4 Remember the ARR stack excludes non-paying clients.

The screenshot displays a Google Sheets spreadsheet titled "HubSpot Financial Model". The spreadsheet is organized into several columns, including "Client Name", "Product", "Status", "Start Date", "End Date", "ARR", and "MRR". The data is sorted by "ARR" in descending order. A sidebar on the right side of the spreadsheet shows "All Formatting options". In the bottom right corner, there is a video call window with two participants: Connor Schone and Greg Coble. The spreadsheet is open in a Google Chrome browser, and the address bar shows the URL "https://docs.google.com/spreadsheets/d/1H3422728-1DC3-4180-8769-827581676215/edit#gid=1620144444". The spreadsheet is titled "HubSpot Financial Model" and includes a search bar at the top left.

A HubSpot export pasted into the model (e.g. the ARR stack / customer list).

FROM THE MEETING TRANSCRIPT — Greg Coble, 00:05:44

"The HubSpot ARR stack file is pulling everything that's set up as a paying client... so if a client is not paying, it's not going to show up."

Step 4 — Update bookings

For the **bookings** tab, export the year-to-date bookings from HubSpot (use its **advanced filters**), then paste in **only the current month's rows** — the prior months are already there. Watch the column alignment: the export layout doesn't always match the proforma, so you may need to line columns up by hand before dragging the formulas across.

- 1 In HubSpot, use advanced filters and export YTD bookings.
- 2 Paste only the **current month's** rows into the matching rows.
- 3 Align columns to the proforma layout; drag formulas across.

The screenshot shows the HubSpot CRM interface with a list of deals. The 'Advanced filters' button is highlighted. A video call window is visible in the bottom right corner.

Exporting bookings from HubSpot to paste the current month into the model.

FROM THE MEETING TRANSCRIPT — Greg Coble, 00:10:57

"You go to advanced filters... we would only be picking up the three lines from July that we need, because the rest of it is already in here... sometimes the columns are a little out of sync."

Step 5 — Reconcile churn & renewals to the CX forecast

Reconcile the **renewals** and **churn** tabs against the Client Experience **forecast sheet** (managed by Tracy in Taylor's absence). This often surfaces errors in the forecast sheet or mismatched closure dates. Then classify each renewal manually into a **price increase**, **expansion**, or **downsell** — check HubSpot to tell **Renewal ARR** from **Software ARR** — because those inputs drive the upsell / expansion / price-increase figures on the P&L Actual tab.

- 1 Match the renewals/churn tabs to the CX forecast sheet; resolve discrepancies.
- 2 Classify each renewal: price increase / expansion / downsell.
- 3 Use HubSpot (Renewal ARR vs Software ARR) to classify correctly.

The screenshot displays a complex financial model spreadsheet. The main table has columns for various metrics, including ARR, churn, and forecast, organized by month and year. The data is presented in a grid format with multiple rows and columns. A video call overlay is visible in the bottom right corner, showing a participant named Greg Coble. The spreadsheet includes various formulas and calculations, with some cells highlighted in red. The overall layout is professional and detailed, typical of a financial model used for forecasting and analysis.

Reconciling renewals/churn against the CX forecast in the model.

Step 6 — Roll ARR forward and refresh the waterfalls

Update the **ARR roll-forward** by adding a new column for the current month and copying the prior month's data across. Refresh the **deferred-revenue** and **bookings waterfalls** by changing the date, clearing out the old data, and dragging the formulas to refresh the view.

- 1 ARR roll-forward: add the new month column; copy the prior month over.
- 2 Waterfalls: change the date, clear old data, drag formulas to refresh.

Don't touch this date. Leave the **3/31/26** date on the Renewals_Build sheet as-is — changing it breaks other formulas in the workbook.

Step 7 — Forecast drivers & department budgets

The forecast is driven by a few inputs. On **Renewals_Build**, the percentages you enter drive forecast **churn**, **price increases**, and **expansions**. On **Bookings_Build**, the forecast = number of sales reps × deals × average deal size. The **department tabs** (COGS, Product, Sales, Marketing, G&A) forecast expenses from the **census** (salaries, benefits, taxes, incentives) and feed the P&L. Infrastructure comes from Jeremy; headcount from the APS and Wise reports; severance is a manual one-time input.

- 1 Set the Renewals_Build %s (churn, price increase, expansion).
- 2 Set Bookings_Build inputs (reps × deals × avg deal size).
- 3 Update the department tabs from the census; add infrastructure (Jeremy) and headcount (APS/Wise).
- 4 Enter severance as a manual one-time input.

The screenshot displays the 'Redbeam Proforma Financial Model' spreadsheet, specifically the 'Department/Census' tab. The spreadsheet is organized into columns for employee details (Name, Title, Department, Salary, etc.) and a series of monthly columns representing financial data from 2016 to 2029. The data is color-coded by department, with various shades of yellow, orange, and red. A sidebar on the right shows a list of employees, and a video call window is visible in the bottom right corner.

A department/census tab — salaries, benefits, taxes, and incentives feeding the P&L.

Step 8 — Watch-outs & where the data comes from

A few things to keep in mind. The **APV report** is produced by Allen — email him on the **1st of each month** for it. HubSpot company IDs change and break the model's lookups (the most common breakage). The **ARR pricing** tab still needs manual summation (filter outside the file, drop the result in). The **budget** is a static file built from the prior year and uploaded to QuickBooks at the consolidated level for actual-vs-budget. Longer term, the plan is to simplify — define the outputs first and rebuild, potentially leaning on Chargebee for cleaner revenue definitions.

- 1 Email Allen on the 1st for the monthly APV report.
- 2 If lookups break, check for changed HubSpot company IDs first.
- 3 Manually sum the ARR pricing tab; keep HubSpot data clean.
- 4 Treat the budget as a static prior-year file loaded to QBO consolidated.

FROM THE MEETING TRANSCRIPT — Greg Coble, 00:27:37

"It works off of company ID... it will pull the data from other tabs based on the company ID. That company ID has changed in HubSpot."

Quick reference

Monthly update order, sources, and glossary

Monthly update order

- 1 Update **P&L Actual** from QuickBooks (paste, date, drag).
- 2 Refresh HubSpot tabs: ARR stack, customer list, renewals, churn (extend filters).
- 3 Update **bookings** (current month only; align columns).
- 4 Reconcile renewals/churn to the CX forecast; classify price increase / expansion / downsell.
- 5 Roll ARR forward; refresh deferred-revenue & bookings waterfalls.
- 6 Update forecast drivers (Renewals_Build, Bookings_Build) and department budgets.
- 7 Request the APV report from Allen (1st of month).

Sources

Data	Where it comes from
P&L actuals	QuickBooks Online (entity-level + consolidated)
Renewals / churn / customer list / ARR stack	HubSpot exports (ARR stack = paying clients only)
Bookings	HubSpot (YTD export, current month pasted in)
APV report	Allen & email on the 1st of the month
Headcount / infrastructure	APS & Wise reports; Jeremy for infrastructure
Budget	Static prior-year file, uploaded to QBO consolidated

Glossary

- **Proforma** — the linked Excel model of P&L actuals, unit economics, and the ARR forecast.
- **ARR stack / roll-forward** — the recurring-revenue base and its month-over-month movement.
- **Waterfall** — a tab showing deferred revenue / bookings building period by period.
- **Renewals_Build / Bookings_Build** — the forecast-driver tabs (percentages; reps × deals × deal size).
- **APV** — Average/Active Project Value; monthly report from Allen.

About the quotes. The green “From the meeting transcript” quotes are verbatim from the meeting’s official Google Meet transcript (lightly trimmed for filler words).
